

NITAI LAB Logistics and Operations

OPERATIONAL PERFORMANCE · TPS AND LEAN

# Where your operation loses money.

A 5-day diagnostic at a terminal, warehouse, mine or plant, with losses quantified in money and a 90-day plan.

Operational Diagnostic

nitailab.com.br

THE STARTING POINT

# The big gain rarely comes from new technology

It comes from what nobody has the patience to look at: a redesigned yard, a rescheduled stockpile, a bottleneck that stayed invisible for years, an expense that became house rule.

The diagnostic is a reading of the shop floor, not a slide committee. The method is the Toyota Production System, implemented with TSSC, Toyota's own consulting arm.

A SIMPLE TEST

Ask the operators on one shift what their biggest difficulty in the operation is. Then ask them to propose solutions.

If you are not surprised, either there is a problem with morale and culture, or the operation is already very well run.

HOW IT WORKS

# Five days, one critical process

DAY 1

## Context

Conversation with the decision-maker and the shop-floor leaders. Choice of the critical process and the plan for the week.

DAY 2

## Field work

A full day in the operation, observing the main point. Missing indicators cross-checked against existing ones.

DAY 3

## Hypotheses

Data gathering and validation in the field. The plan starts to take shape.

DAY 4

## Validation

More field work if needed. Losses valued in money. Consolidation.

DAY 5

## Presentation

Executive readout to the decision-maker and a direction-setting meeting with the operations team.

The operation keeps running throughout. Five days do not cover everything: the field reading decides what to tackle first.

DELIVERABLES AND TOPICS

# What the company keeps

- Executive presentation for the decision-maker
- Direction-setting presentation for the operations team
- Visual strategic A3
- Diagnostic, 90-day action plan and proposed indicators
- One-page executive summary

Implementing the plan is a separate scope, engaged afterwards if there is interest.

WHERE LOSSES USUALLY SIT

- **Capacity and bottlenecks** almost always roles, not equipment
- **Cost per tonne** what makes up the number
- **Contracts and third-party services** scope still paid for that the operation no longer uses
- **Planned shutdowns** stopping without losing production
- **Budget and EBITDA per unit**

RESULTS

# Results achieved over my career

**BRL 3.9M**
saved in one year, with volume above budget

**BRL 8.1M**
cut from the budget by redesigning wagon unloading

**50%+**
cut in the operating budget over three years

**BRL 2M**
saved per year by restructuring service contracts

CASE

### The pen on the glass

Roles reassigned by step, without adding staff: close to 50% more unloading capacity.

METHOD

### TPS with Toyota itself

Implemented with TSSC; the terminal became VLI's TPS school, with immersions for professionals from across the company.

WHO LEADS THE WORK

# Nitai Morais

16 years in the Vale Group, across Vale and VLI: commercial roles, planning of terminals integrated with rail and port, and operations management, leading teams of up to 250 people. TPS implementation with TSSC, Toyota's own consulting arm.

## BRL 500M

in annual revenue from the terminal operations he planned

## 15 Mt

of grain exported under plans he drew up

## 1.8 Mt

of pig iron exported in the account portfolio he managed

## 16 years

in the Vale Group, with 18 promotions

NEXT STEP

# An initial assessment of your case

Tell me the type of operation and the main problem. I will reply with where to start and the format of the diagnostic.

- Scope, timeline and fee agreed before work starts
- Confidentiality and non-circumvention both ways
- First conversation free of charge
